

**STERIS introduces its new AIRPORT equipment management system**

**Make space work for you**

The ever-increasing amount of sophisticated equipment required by today's exacting medical standards is making space a real issue in operating suites. STERIS has a solution to this problem: AIRPORT, a new equipment management system (EMS) that combines ergonomics with scalability.

**A solution to every requirement**

AIRPORT has been developed in collaboration with medical teams to accommodate all types of surgical procedure, from general surgery and anaesthesia, to surgical specialities and minimally invasive surgery. Exceptionally modular, it can be tailored exactly to specific needs and at the right price. Simple yet clever solutions, such as gas and electrical connections directly on the column, make it possible to have essential functions at a low price. EMSs capable of carrying heavier loads and offering a wide range of movements will be subsequently made available. Until then, the standard solutions available will meet most requirements.

**Quality and variety**

AIRPORT boasts a wide range of accessories — from shelves of various sizes and built with a wide choice of drawers, to mounts for flat screens and keyboards — that offer virtually endless possibilities. All feature quality construction and finishes. What is more, our teams guide you throughout your projects and help you to achieve the best cost-effectiveness ratio for your system. With AIRPORT you have a solution that is tailored to your needs as well as your budget.

**Future forward**

An EMS worthy of the name must meet not only your current expectations, but your future needs as well. AIRPORT features a clever design that accommodates your needs as they change. Its standardised ceiling attachments allow the installation of additional arms and lights. Each arm features a generously sized (120 mm) internal cable routing compartment so that new equipment can be added without having to alter AIRPORT, even in the case of its lightweight models. Last but not least, additional modules can be installed with great ease on the side of the system to increase its capabilities.

Such capabilities are essential in order to upgrade your surgical suite with an integration solution. With the AIRPORT range, you can easily add video connections and equipment so that all your audio, video and data streams are managed in a single place. When you have an EMS that grows with your needs, you also have the guarantee of freedom of choice and lasting use.

**Technology that is so transparent, you forget that it's there**

From its smooth, rounded shapes, to the number of exposed screws reduced to the bare minimum, and its concealed cable routing compartments, the AIRPORT range is designed down to the smallest details to ensure effortless cleaning and decontamination. One of the range's most ergonomic features is its retractable handles which control the electro-pneumatic brakes for precise, effortless positioning. Exceptionally compact and elegant and available in matching colours, AIRPORT blends in so well with its surroundings that you almost forget that it's there!
